

Beak Speak

A publication of **Flock Fighters USA**

Issue 1, 2004

Upcoming Events

Flock Fighters USA will be attending the Wineries Unlimited Seminars and Trade Show for the Eastern US and Canada. It will be held in Lancaster, PA, during March 16-17.

We will also be attending the Transmission and Distribution World Expo in Indianapolis, IN on May 24-26.

Stop by our booths and check us out!

Did you know?

- Flock Fighters USA has received an endorsement from the Humane Society of the United States.
- Flock Fighters USA is a licensed applicator and provides services around America.
- Flock Fighters USA is currently the nation's largest distributor of MA products.

Fogging: Thermal vs. ULV

Methyl Anthranilate can be atomized with both hot and cold aerosol production. Both processes present the active ingredient, MA, in very small droplets (5-25 microns). Both float along air currents affecting any birds downwind. There are some differences, however. Which type of fogger, hot (thermal) or cold (ULV), is right for you?

Thermal (hot) fogging uses heat to flash-evaporate the product into a cloud (similar to burning scented candles or incense sticks to release the fragrance). Thermal fogging equipment produces a highly visible fog that consists predominantly of MA and water vapor. The heat-produced plume has the capacity to rise and spread quickly, filling structures, with or without air currents. Thermal fogs are more dependant on climate and relative humidity than are ULV fogs. Thermal fogging is the technology of choice to reach above trees, tall buildings, or rafters.

Flock Fighters USA supplies a full range of equipment for aerosol bird control.

ULV (cold) fogging uses large amounts of air to create an invisible MA plume (similar to deodorant and hair spray products). With no energy other than the force of air, the product stays more horizontal to the release point. With misting, there is no chemical change of the product. This equipment enables droplets of a more precise size to be generated. The absence of a large number of very small droplets will limit the penetration of the fog into highly obstructed areas. Misting is particularly useful when the desire is to keep public display to a minimum.

3 MA Products by Rejexit

Fog Force is a bird repellent that may be used indoors and outdoors to repel all types of birds, including starlings, blackbirds, gulls, Canada geese and any other bird that has become a nuisance or a health hazard in an area. Fog Force is best applied by a thermal or ULV fog generator.

Migrate is a goose repellent for turf areas such as golf courses, lawns, parks, athletic fields, cemeteries or other areas where birds graze. It is a micro-encapsulated product that should be mixed with water. Migrate can also be tank mixed with most other turf products.

Crop Guardian is a bird repellent that is used to reduce damage to berry crops. It is approved to be used on grapes, blueberries and cherries, and protects against all types of birds. Crop Guardian allows you to protect your crop right up to the day of harvest with no damages to your fruit.

Bird Control Calendar

Spring is a time when migratory birds can begin to affect a site. The time they spend on your site may be short, but the consequences are extreme.

→ **February/March-** Geese

cause turf damage and pollute lawns and ponds.

→ **March/April-** Pigeons deposit excessive amounts of manure.

→ **March-July-** Seagulls produce nuisance to marinas, recreation areas and landfills.

→ **May-**

Flocks of birds cause excessive damage to fruit crops.

Relief is available for these situations!

Flock Fighters USA is the Nation's Leader in bird aversion! Contact us for help in removing the birds from YOUR site!
